
ABSTRACT OF THE DISCLOSURE

The ear syringe tip as embodied in this filing would have soft, catheter like tip as compared to the hard inflexible tips of the older versions. The ear syringe tip would also have very smooth rounded edges as compared to the sharp edges of predecessors tips. Instead of being fixed onto a syringe this tip is removable and disposable in order to facilitate use and prevent disease transmission. The catheter can also be fitted with a clip on depth shield that serves as a guide as to the tip depth, prevents the tip being inadvertently inserted too deeply and prevents splash back of fluid onto the operator. The above features would greatly reduce the risk of injury and transmission of disease whilst increasing efficiency.
